RESULTS:

Normal cardiovascular examination via auscultation - No evidence of congenital or acquired heart disease was noted. Since acquired heart disease may develop later, these evaluation results remain valid for one year, and annual examinations are recommended to continue to monitor cardiac health.

Case Description: Completed / Regular / X-ray / Specific region(s)

Case History:

Preliminary study of the hips/elbows.

Case Report:

557006 KW/ml

Three digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographs are dated 3/17/22.

Radiographic Findings:

Both femoral heads are well-seated in their respective acetabula with greater than 50% of the femoral heads located medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Diagnosis: Normal pelvis and elbows.

Comments: Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme evaluating hips, the hips would be rated as excellent in conformation. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude elbow and hip dysplasia and to establish a final rating on the coxofemoral joints.
